

# Annotation of Multiword Expressions in the Prague Dependency Treebank

Eduard Bejček and Pavel Straňák

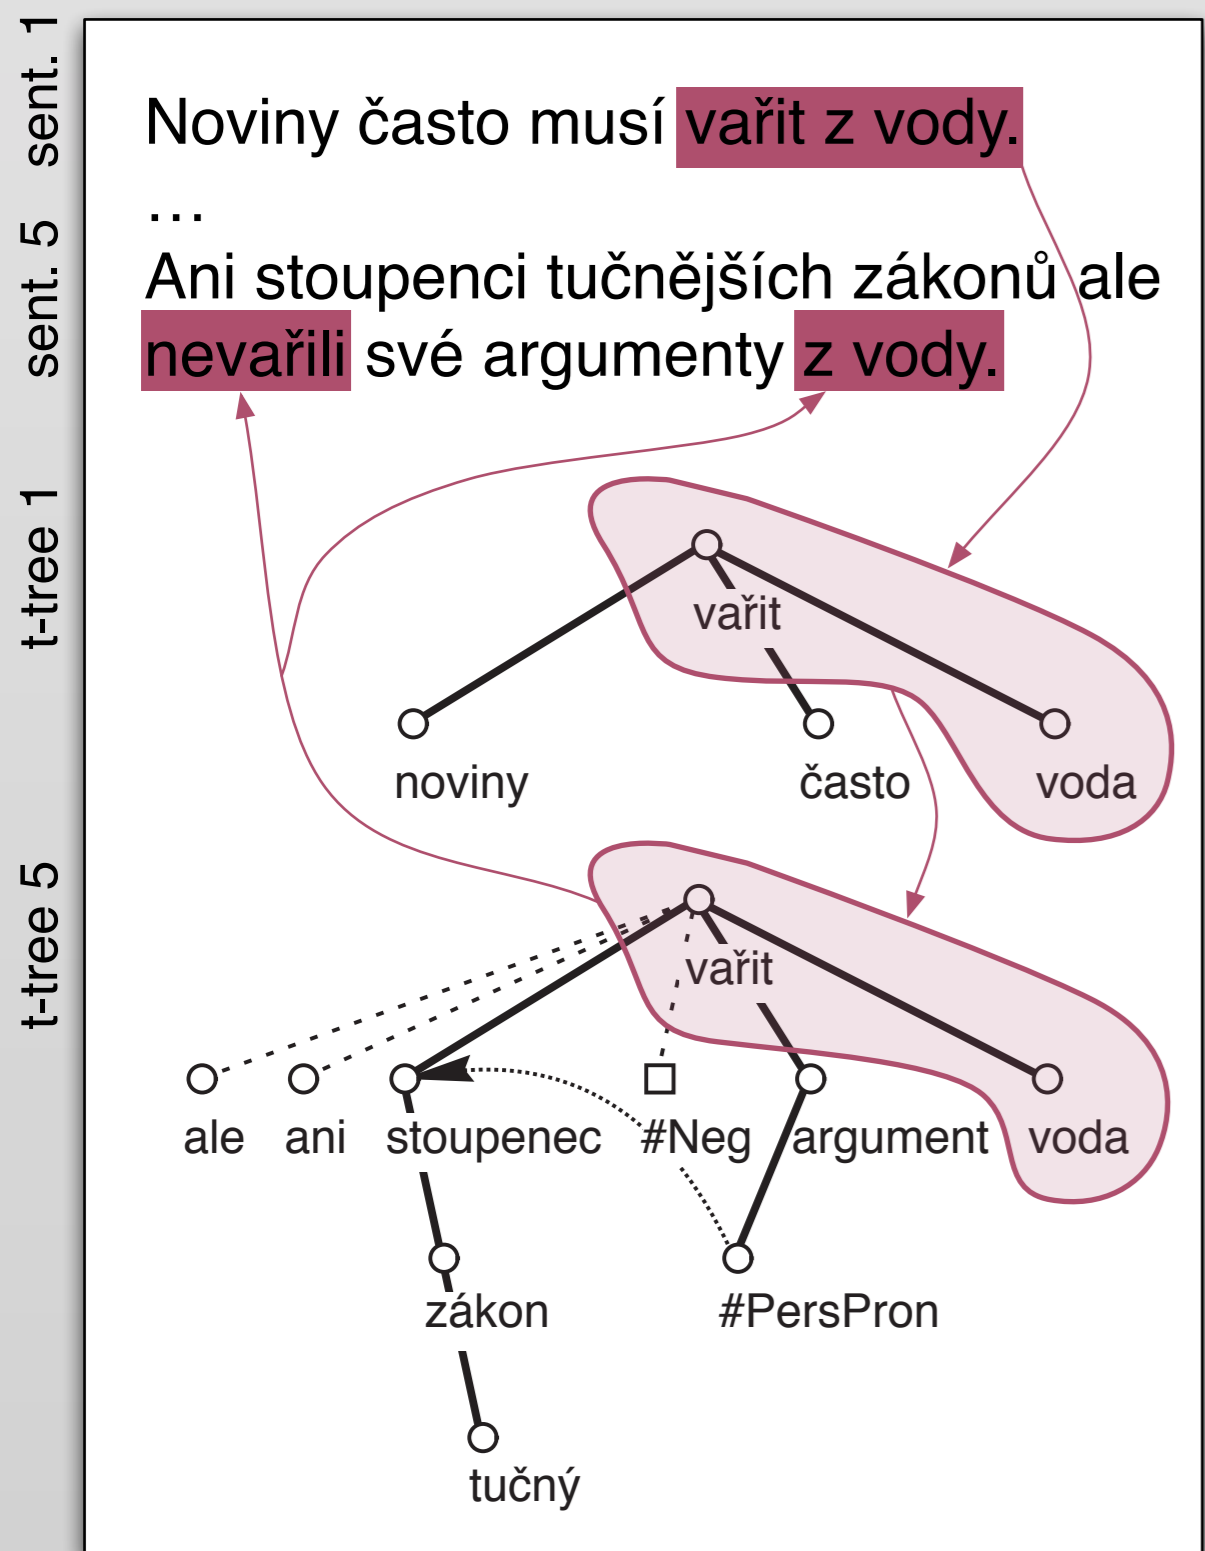

ÚSTAV FORMÁLNÍ  
A APLIKOVANÉ LINGVISTIKY

We annotate multiword expressions (MWEs) in Prague Dependency Treebank (1).  
 We use PML scheme to capture the annotation of whole PDT as well as of our MWEs (2). Our aim is to improve a representation of MWEs (incl. named entities) in t-trees (3).  
 Our annotators work with an annotation tool (5) and mark occurrences in sentences, which are generated from the deep syntactic layer (t-layer) of PDT: see 1, 2, 4. A MWE lexicon SemLex is produced (6).  
 We use PML-TQ (7) to query PDT including the MWE data.

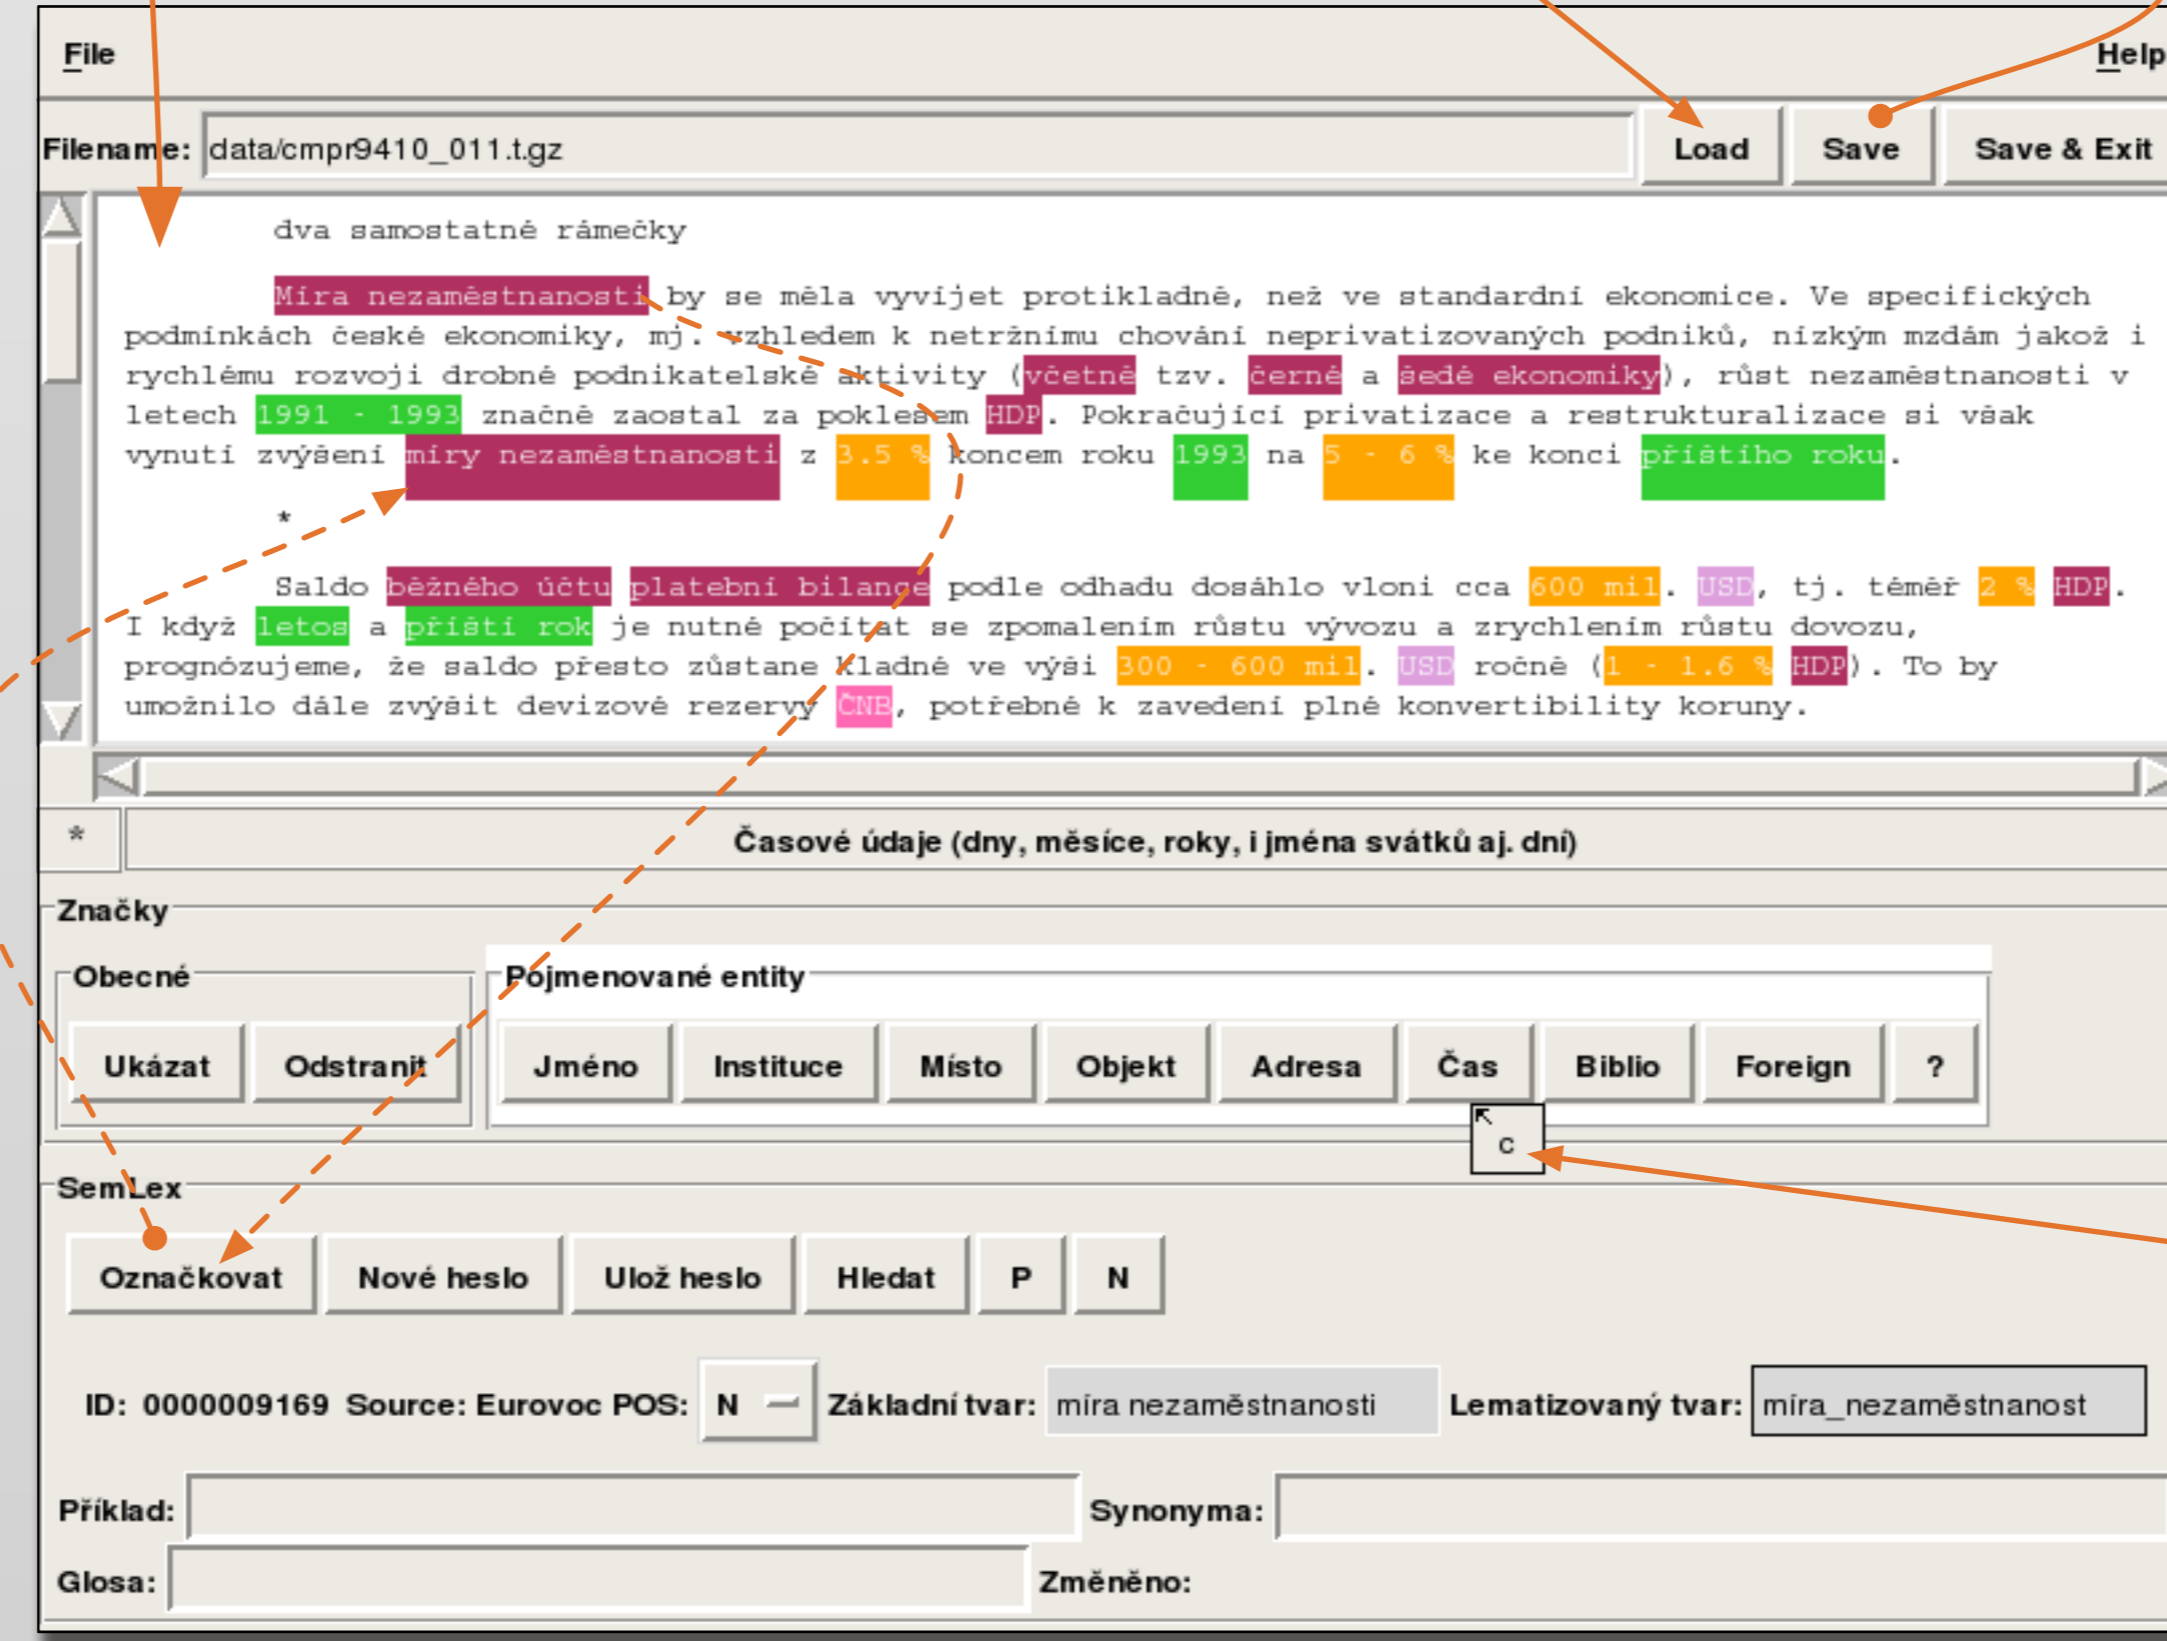

1 PDT 2.0

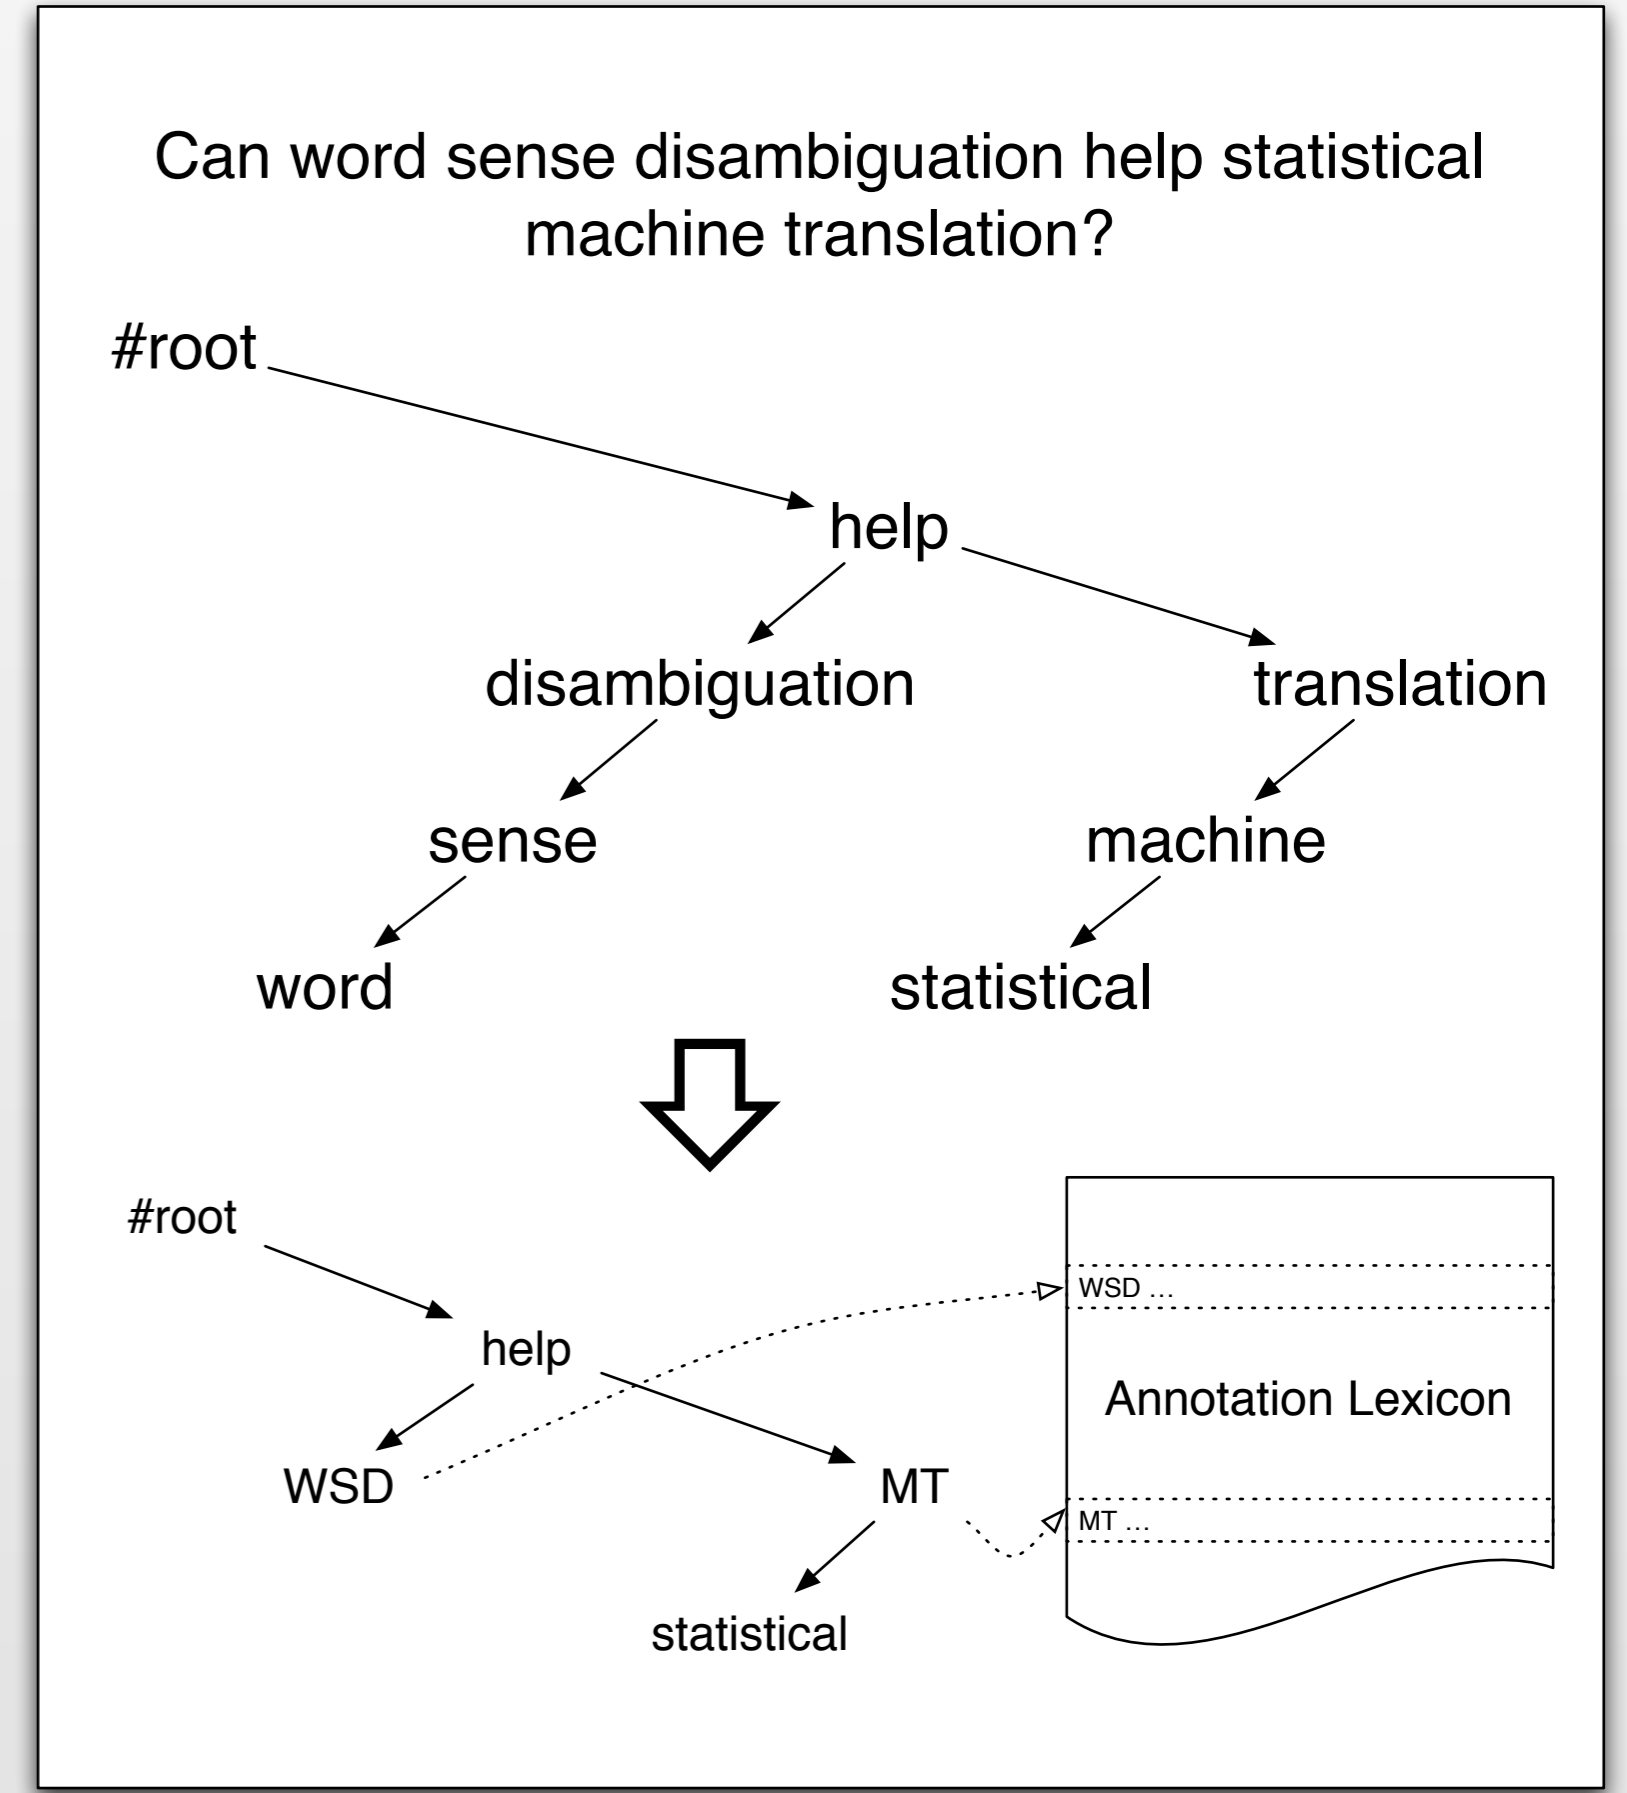

4 Use of t-trees in the pre-annotation

2 Annotate a new MWE + automatic pre-annotation of all other occurrences (see 4)

5 Annotation interface

3 Scheme of changes

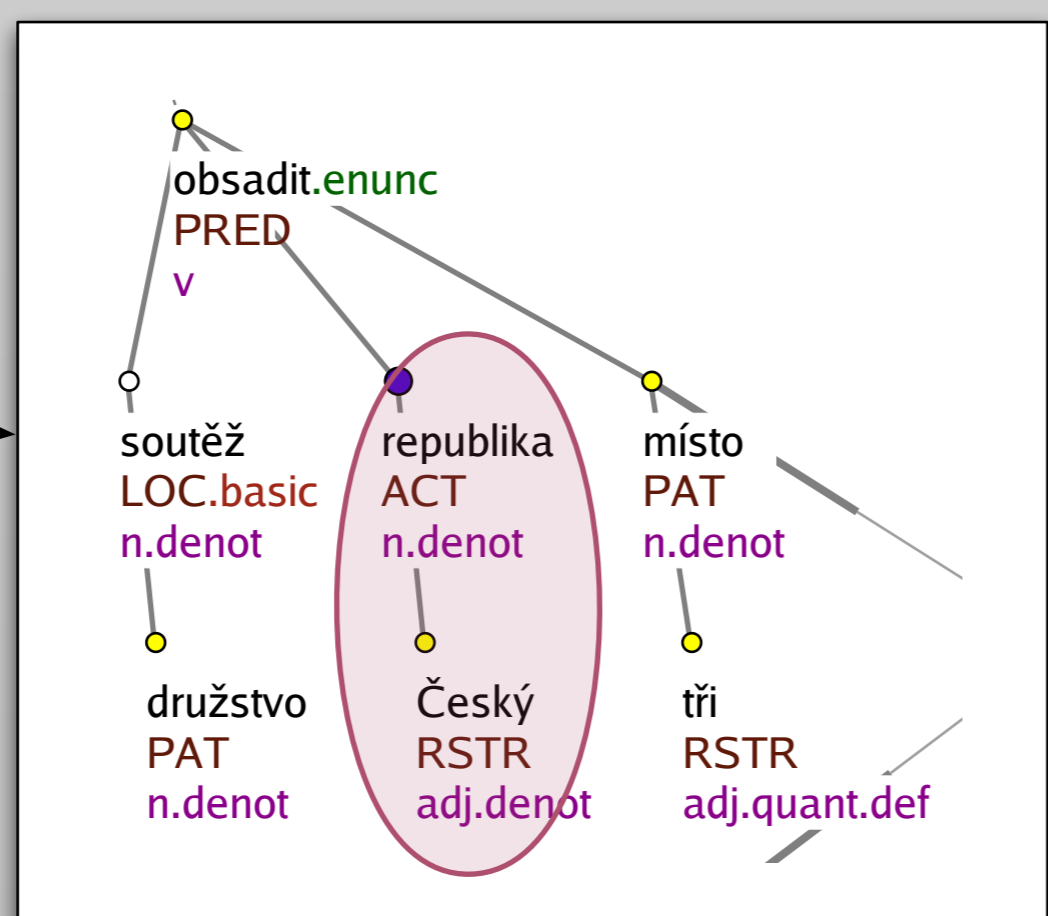

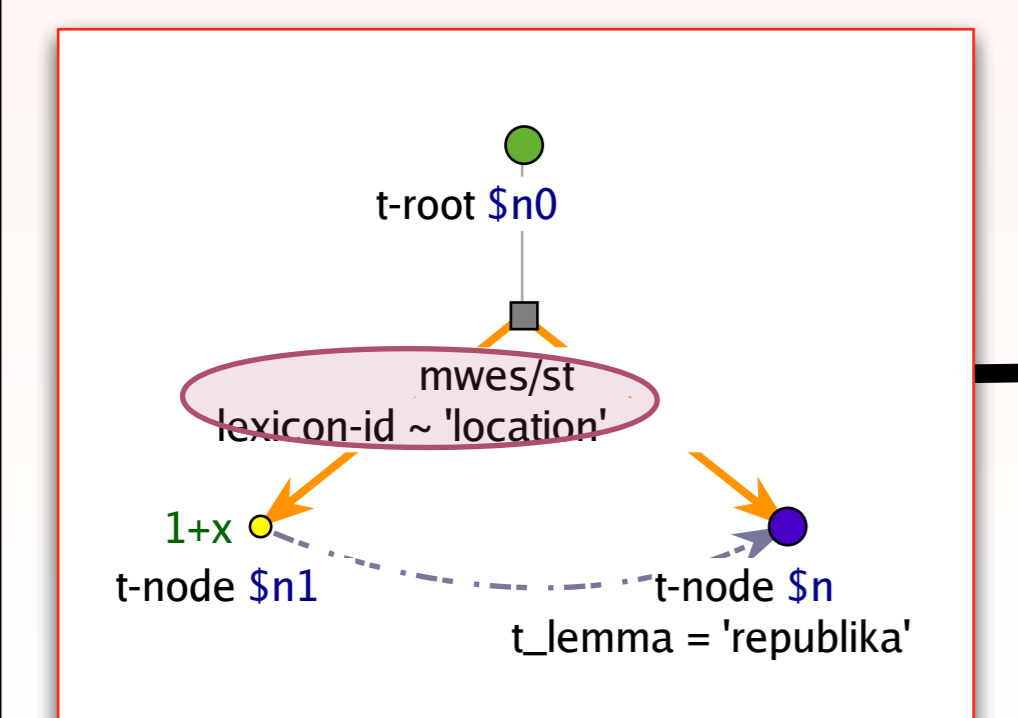

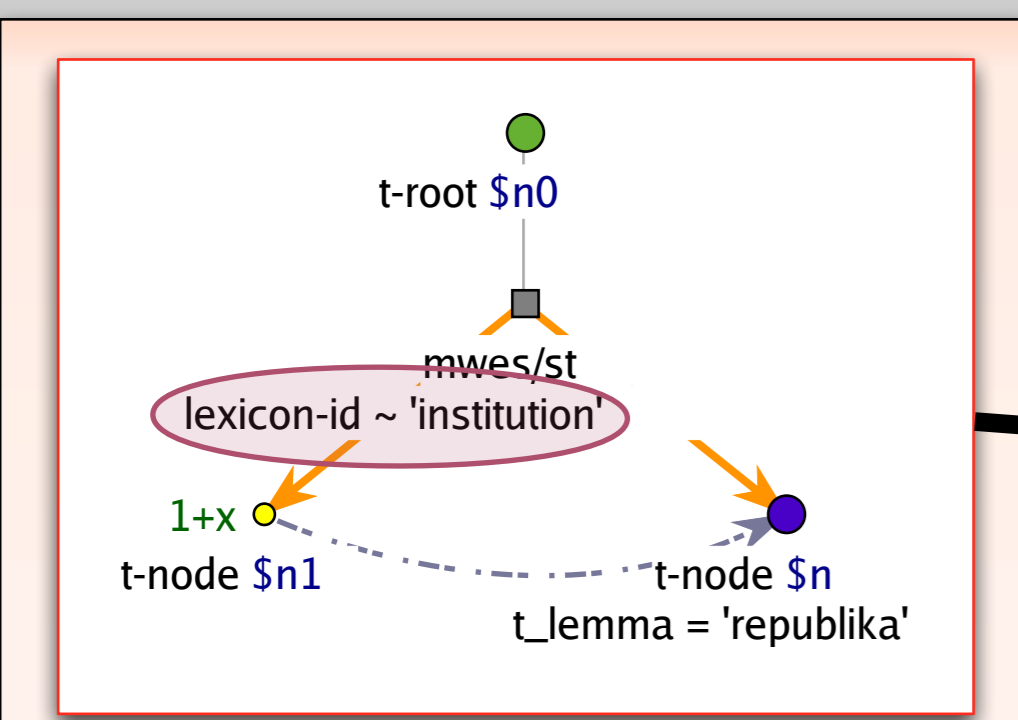

```

- !perl/hash:SemLex_heslo
BASIC_FORM: vykročit ve stopách
CREATED: 090820221315
EXAMPLE: "vykročila ve stopách svého otce"
GLOSS: "následovat, započít stejnou životní dráhu"
ID: 0000030967
LEMATIZED: vykročit ve stopa
MODIFIED: 090820221334
MODIFIER: vimprova
ORIGID: ~
POS: V
SOURCE: vimprova
SYNONYMS: ~
  
```

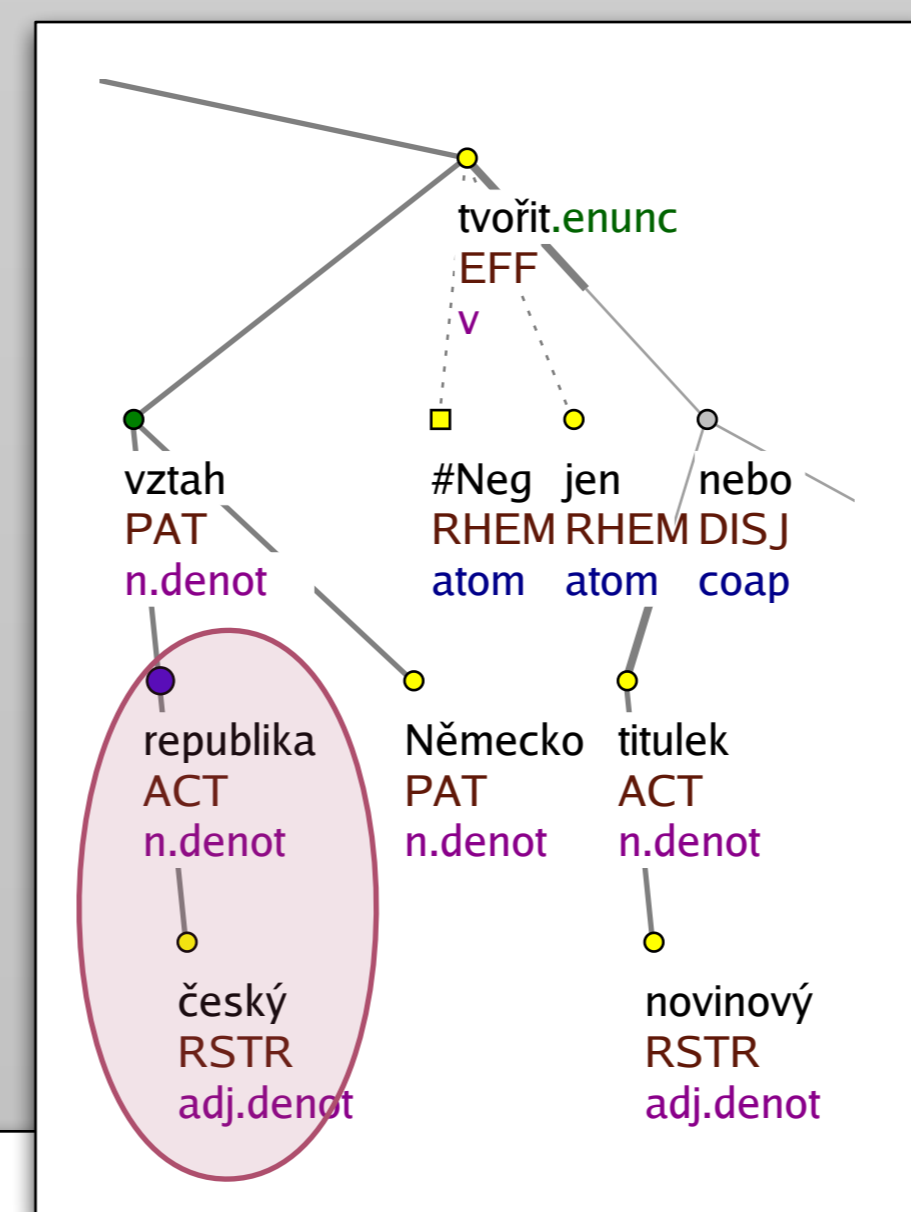

6 A SemLex entry ("follow in one's footsteps")

one-key shortcuts for annotation  
searchable SemLex browser and editor

7 PML-TQ queries over MWEs in the PDT

In the competition [of] teams [the] Czech republic took the 3rd place ...

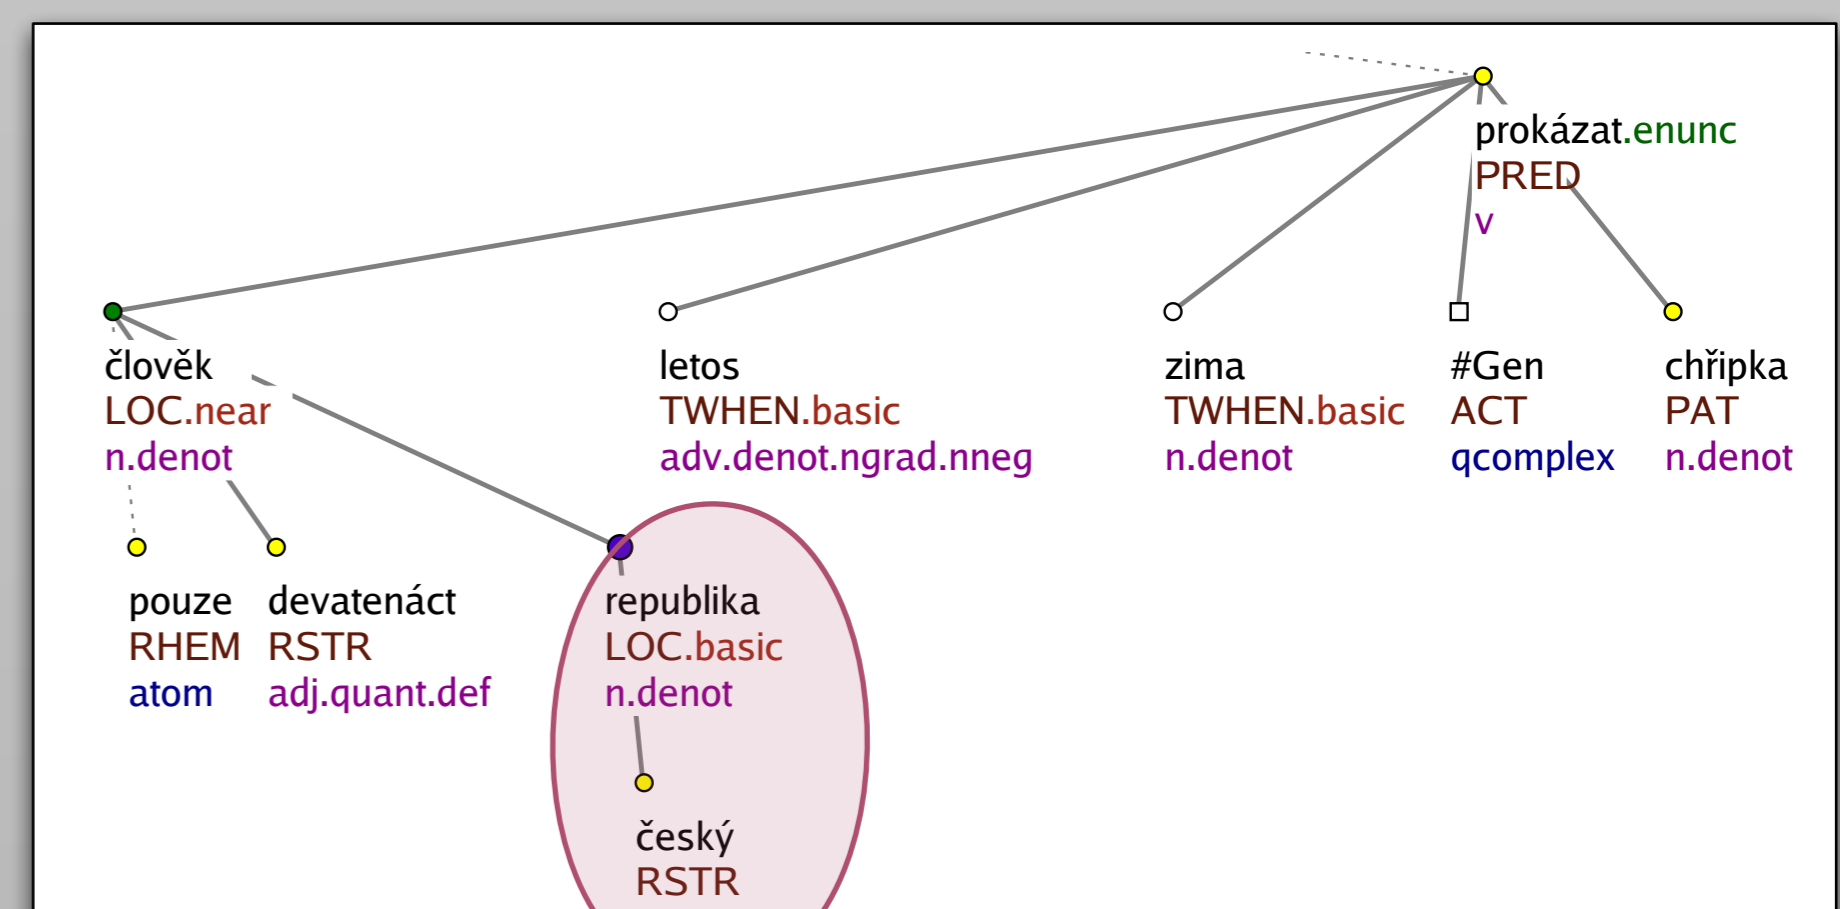

In the 4th quarter of the year ... came into [the] Czech Republic ...

```

t-root $n0 := ...
[ member mwes/st
  [ lexicon-id ~ 'institution',
    tnodes t-node $n1 :=
    [ ancestor $n ],
    tnodes t-node $n :=
    [ t_lemma = 'republika' ] ] ];
  
```

>> give distinct \$n0.id,concat(\$n1.id, ' ' over \$n sort by \$n1.deepord), \$n.id,concat(\$n1.t\_lemma, ' ' over \$n sort by \$n1.deepord), \$n.t\_lemma sort by \$1

An output filter can produce various lists from results of a query

Only 19 people in [the] Czech Republic ...
