

# NPFL099 Statistical Dialogue Systems

## 11. Linguistics & Ethics

<http://ufal.cz/npfl099>

**Ondřej Dušek** & Vojtěch Hudeček

15. 12. 2020

Charles University  
Faculty of Mathematics and Physics  
Institute of Formal and Applied Linguistics

unless otherwise stated

# Turn-taking (interactivity)

- Speakers **take turns** in a dialogue
  - **turn** = continuous utterance from one speaker
- Normal dialogue – very fluent, fast
  - minimizing **overlaps** & **gaps**
    - little silence (usually <250ms), little overlap (~5%)
    - (fuzzy) rules, anticipation
  - cues/markers for turn boundaries:
    - linguistic (e.g. finished sentence), voice pitch
    - timing (gaps)
    - eye gaze, gestures (...)
- overlaps happen naturally
  - ambiguity in turn-taking rules (e.g. two start speaking at the same time)
  - **barge-in** = speaker starts during another one's turn

# Turn-taking (example)

<https://youtu.be/BZF9eg35IXI?t=91>

20 seconds of a semi-formal dialogue (talk show):

S: um uh , you're about to start season [six ,]

J: [yes]

S: you probably already started but [it launches]

J: [yes thank you]

A: (*cheering*)

J: we're about to start thank you yeah .. we're starting , we- on Sunday yeah ,  
we've been eh- we've been prepping some [things]

S: [confidence] is high . feel good ?

J: (*scoffs*)

S: think you're gonna  
[squeeze out the shows this time ? think you're gonna do it ?]

J: (*laughing*) [you're talking to me like I'm an a-]  
confidence high ? no !

S: [no]

J: [my confidence] is never high .

S: okay

J: self loathing high . concern astronomic .

# Speech vs. text

- Natural speech is **very different from written text**

- ungrammatical
- restarts, hesitations, corrections
- overlaps
- pitch, stress
- accents, dialect

- See more examples in speech corpora

- <https://kontext.korpus.cz/> (Czech)
- select the “oral” corpus and search for a random word

The screenshot displays the 'Výchozí zobrazení | Promluvy' (Default view | Speeches) section of the Kontext Korpus website. It shows a list of speech examples with speaker names and audio icons. The examples are as follows:

Speaker	Speech Example
Linda_7158	no já sem to četla v novinách
Otakar_7651	no
Otakar_7651	hovno
Dalibor_7582	si ho* v nedělu hodil mašlu ..
Otakar_7651	ty vole
Dalibor_7582	mně to říkal Martin že to četl v novinách já říkám no tak tady -
Linda_7158	taji mám ty noviny .
Otakar_7651	to von byl takovej divné ale
Dalibor_7582	ale si mně řekni skrz peníze to určitě nebylo že by jako byl
Dalibor_7582	se mu jak to jelo ..
Otakar_7651	tak to určitě ne
Otakar_7651	dyť tam peněz bylo jako .
Dalibor_7582	a to je ten jak byl na té železnici jak tam vjel
Dalibor_7582	sám
Otakar_7651	no
Otakar_7651	to

# Turn taking in dialogue systems

- consecutive turns are typically assumed
  - system waits for user to finish their turn (~250ms non-speech)
- **voice activity detection**
  - binary classification problem – “is it user’s speech that I’m hearing?”[Y/N]
  - segments the incoming audio (checking every X ms)
  - actually a hard problem
    - nothing ever works in noisy environments
- **wake words** – making VAD easier
  - listen for a specific phrase, only start listening after it
- some systems allow user’s barge-in
  - may be tied to the wake word

*hey Siri*  
*okay Google*  
*Alexa*

# Speech acts (by John L. Austin & John Searle)

- each utterance is an **act**
  - intentional
  - changing the state of the world
    - changing the knowledge/mood of the listener (at least)
    - influencing the listener's behavior
- speech acts consist of:
  - a) **utterance** act = the actual uttering of the words
  - b) **propositional** act = semantics / “surface” meaning
  - c) **illocutionary** act = “pragmatic” meaning
    - e.g. command, promise [...]
  - d) **perlocutionary** act = effect
    - listener obeys command, listener's worldview changes [...]

X to Y: *You're boring!*

- a) [jʊr 'bɔːrɪŋ]
- b) boring(Y)
- c) statement
- d) Y is cross

X to Y: *Can I have a sandwich?*

- a) [kæn aɪ hæv ə 'sændwɪtʃ]
- b) can\_have(X, sandwich)
- c) request
- d) Y gives X a sandwich

# Speech acts

- Types of speech acts:

- **assertive**: speaker commits to the truth of a proposition
  - statements, declarations, beliefs, reports [...]
- **directive**: speaker wants the listener to do something
  - commands, requests, invitations, encouragements
- **commissive**: speaker commits to do something themselves
  - promises, swears, threats, agreements
- **expressive**: speaker expresses their psychological state
  - thanks, congratulations, apologies, welcomes
- **declarative**: performing actions (“performative verbs”)
  - sentencing, baptizing, dismissing

*It's raining outside.*

*Stop it!*

*I'll come by later.*

*Thank you!*

*You're fired!*

# Speech acts

- Explicit vs. implicit

- explicit – using a verb directly corresponding to the act
- implicit – without the verb

explicit: I **promise** to come by later.  
implicit: I'll come by later.

explicit: I'm **inviting** you for a dinner.  
implicit: Come with me for a dinner!

- Direct vs. indirect

- **indirect** – the surface meaning does not correspond to the actual one
  - primary illocution = the actual meaning
  - secondary illocution = how it's expressed
- reasons: politeness, context, familiarity

direct: Please close the window.  
indirect: Could you close the window?  
even more indirect: I'm cold.

direct: What is the time?  
indirect: Have you got a watch?

# Conversational Maxims (by Paul Grice)

- based on Grice's **cooperative principle** (“dialogue is cooperative”)
  - speaker & listener cooperate w. r. t. communication goal
  - speaker wants to inform, listener wants to understand
- 4 Maxims (basic premises/principles/ideals)
  - M. of **quantity** – don't give too little/too much information
  - M. of **quality** – be truthful
  - M. of **relation** – be relevant
  - M. of **manner** – be clear
- By default, speakers are assumed to adhere to maxims
  - apparently breaking a maxim suggests a different/additional meaning

# Conversational Implicatures

- **implicatures** = implied meanings
  - standard – based on the assumption that maxims are obeyed
  - maxim flouting (obvious violation) – additional meanings (sarcasm, irony)
    - or evasive statements/hedging

*John ate some of the cookies* → [otherwise too little/low-quality information] not all of them

*A: I've run out of gas.*

*B: There's a gas station around the corner.* → [otherwise irrelevant] the gas station is open

*A: Will you come to lunch with us?*

*B: I have class.* → [otherwise irrelevant] B is not coming to lunch

*A: How's John doing in his new job?*

*B: Good. He didn't end up in prison so far.* → [too much information] John is dishonest / the job is shady

Evasive statements (Donald Trump in hospital with covid):

*[...] it came off that we were trying to hide something, which wasn't necessarily true*

*Anything below 90? – No, it was below 94%. It wasn't down in to the low 80s or anything, no.*

<https://twitter.com/yoavgo/status/1312792039105466370>

<https://twitter.com/yamiche/status/1312785068021239812>

<https://www.northcountrypublicradio.org/news/npr/920090761/transcript-sunday-update-on-trump-s-health-from-his-doctors>

# Speech acts, maxims & implicatures in dialogue systems

- Learned from data / hand-coded
- Understanding:
  - tested on real users → usually knows indirect speech acts
  - implicatures limited – there's no common sense
    - (other than what's hand-coded or found in training data)

*system: The first train from Edinburgh to London leaves at 5:30 from Waverley Station.*

*user: I don't want to get up so early. → [fails]*

- Responses:
  - mostly strive for clarity – user doesn't really need to imply

# Grounding

- dialogue is cooperative → need to ensure mutual understanding
- **common ground**  
= shared knowledge, mutual assumptions of dialogue participants
  - not just shared, but **knowingly** shared
  - $x \in \text{CG}(A, B)$ :
    - A & B must know x
    - A must know that B knows x and vice-versa
  - expanded/updated/refined in an informative conversation
- validated/verified via **grounding signals**
  - speaker **presents** utterance
  - listener **accepts** utterance by providing evidence of understanding

# Grounding signals / feedback

- used to notify speaker of (mis)understanding
- positive – understanding/acceptance signals:
  - **visual** – eye gaze, facial expressions, smile [...]
  - **backchannels** – particles signalling understanding *uh-uh, hmm, yeah*
  - **explicit feedback** – explicitly stating understanding *I know, Yes I understand*
  - **implicit feedback** – showing understanding implicitly in the next utterance

*U: find me a Chinese restaurant*

*S: I found three Chinese restaurants close to you [...]*

*A: Do you know where John is?*

*B: John? Haven't seen him today.*

- negative – misunderstanding:
  - **visual** – stunned/puzzled silence
  - **clarification requests**  *A: Do you know where John is?*  
*B: Do you mean John Smith or John Doe?*
  - demonstrating ambiguity & asking for additional information
  - **repair requests** – showing non-understanding & asking for correction

*Oh, so you're not flying to London? Where are you going then?*

# Grounding (example)

T: [...] And the ideology is also very against mixed-race couples. So that was also a target. Whenever we saw mixed-race couples, we attacked them.

E: Was there ever a moment back there where you felt a tiny bit bad about it?

T: No.

E: No? So you were absolutely convinced that you're doing the right thing...

T: Yeah, for quite some time (nods), yeah.

E: ... for the sake of the white race and et cetera?

E: No doubt at all?

T: Well I got doubt eventually, roughly a year before I left the movement [...]

<https://video.aktualne.cz/dvtv/cernoch-mi-miril-pistoli-na-hlavu-nevim-proc-me-nezabil-rika/>  
(2:45 and onwards)

# Grounding in dialogue systems

- Crucial for successful dialogue
  - e.g. booking the right restaurant / flight
- Backchannels / visual signals typically not present
- **Implicit confirmation** very common
  - users might be confused if not present
- **Explicit confirmation** may be required for important steps
  - e.g. confirming a reservation / bank transfer
- **Clarification & repair requests** very common
  - when input is ambiguous or conflicts with previously said
- Part of dialogue management
  - uses NLU confidence in deciding to use the signals

- Dialogue is a **social interaction**
  - people view dialogue partners as goal-directed, intentional agents
  - they analyze their partners' goals/agenda
- Brain does not listen passively
  - projects hypotheses/interpretations on-the-fly
- **prediction** is crucial for human cognition
  - people predict what their partner will (or possibly can) say/do
  - continuously, incrementally
  - unconsciously, very rapidly
  - guides the cognition
- this is (part of) why we understand in adverse conditions
  - noisy environment, distance

# Prediction in dialogue systems

- Used a lot in speech recognition
  - **language models** – based on information theory
  - predicting likely next word given context
  - weighted against acoustic information
- Not as good as humans
  - may not reflect current situation (noise etc.)
  - (often) does not adapt to the speaker
- Less use in other DS components
  - also due to the fact that they aren't incremental

# Alignment/entrainment

- People subconsciously **adapt/align/entrain** to their dialogue partner over the course of the dialogue

- wording (lexical items)
- grammar (sentential constructions)
- speech rate, prosody, loudness
- accent/dialect

*pram* → *stroller* [BrE speaker]  
*lorry* → *truck* [talking to AmE speaker]

S: [...] *Confidence is high, feel good?*  
[...]

J: **Confidence high**? No!

S: No.

J: My **confidence is** never **high**.

S: Okay.

J: **Self loathing high**, concern astronomic.

- This helps a successful dialogue
  - also helps social bonding, feels natural

# Alignment in dialogue systems

(Dušek & Jurčiček, 2016)  
<http://www.aclweb.org/anthology/W16-3622>

- Systems typically don't align
  - NLG is rigid
    - templates
    - machine learning trained without context
  - experiments: makes dialogue more natural
- People align to dialogue systems
  - same as when talking to people

context            *is there a later option*  
response DA    [implicit\\_confirm\(alternative=next\)](#)  
base NLG        Next connection.  
+ alignment     You want a later option.

context            *I need to find a bus connection*  
response DA    [inform\\_no\\_match\(vehicle=bus\)](#)  
base NLG        No bus found, sorry.  
+ alignment     I'm sorry, I cannot find a bus connection.

*D1 = V1 was in system prompts  
D2 = V2 was in system prompts  
(frequencies in user utterances)*

Words	D1 Freq. (% rel. Freq)	D2 freq (% rel. Freq)
V1: next	13204 (99.9%)	492 (82.9%)
V2: following	3 (0.1%)	101 (17.1%)
V1: previous	3066 (100%)	78 (44.8%)
V2: preceding	0 (0%)	96 (55.2%)
V1: now	6241 (99.8%)	237 (80.1%)
V2: immediately	10 (0.2%)	59 (19.9%)
V1:leaving	4843 (98.4%)	165 (70.8%)
V2: departing	81 (1.6%)	68 (29.2%)
V1: route/schedule	2189 (99.9%)	174 (94.5%)
V2: itinerary	2 (0.1%)	10 (5.5%)
V1: okay/correct	1371 (49.3%)	48 (27.7%)
V2: right	1409 (50.7%)	125 (72.3%)
V1: help	2189 (99.9%)	17 (65.3%)
V2: assistance	1 (0.1%)	9 (34.7%)
V1: query	6256 (99.9%)	70 (20.4%)
V2: request	3 (0.1%)	272 (79.6%)

# Politeness

- Dialogue as social interaction – follows **social conventions**

- **indirect is polite**

- this is the point of most indirect speech acts
- clashes with conversational maxims (m. of manner)
- appropriate level of politeness might be hard to find
  - culturally dependent

- face-saving (Brown & Levinson)

- positive face = desire to be accepted, liked
- negative face = desire to act freely
- **face-threatening acts** – potentially any utterance
  - threatening other's/own negative/positive face
- politeness softens FTAs

*Open the window.*  
*Can you open the window?*  
*Would you be so kind as*  
*to open the window?*  
*Would you mind closing the window?*

threat to	positive face	negative face
self	apology, self-humiliation	accepting order / advice, thanks
other	criticism, blaming	order, advice, suggestion, warning

- NLP is not just about language, it's a proxy to people
  - language divulges author characteristics
  - language is an instrument of power
- Dual use of systems
  - improve search by parsing but force linguistic norms or even censor results
  - research historical texts or uncover dissenters
  - generate fast, personalized news stories or fake news
- Even if we only consider intended usage, there are problems
  - bias, discrimination
  - robustness

(Hovy & Spruit, 2016)  
<https://www.aclweb.org/anthology/P16-2096>

<https://slideslive.com/38929585/what-i-wont-build>

<https://www.bbc.com/news/technology-50779761>  
<https://www.wsj.com/articles/readers-beware-ai-has-learned-to-create-fake-news-stories-11571018640>

# Questionable Usages

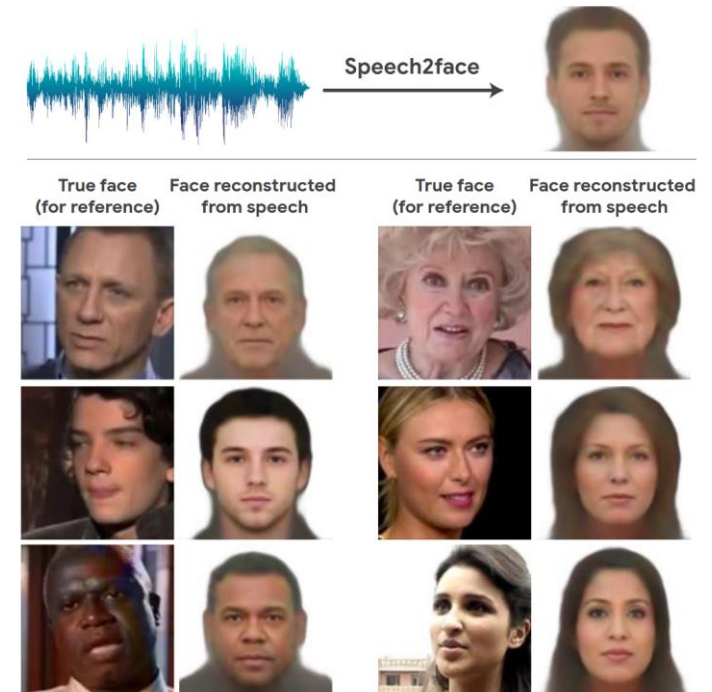

- Some proposed NLP tasks are questionable by definition
  - predicting intellect/personality from text snippets
    - given university entrance tests
      - free text answers to questions
      - IQ, knowledge and other capabilities tests
    - will hurt people who don't fit norms
  - predicting face from voice
    - given a few seconds of audio
    - trained from audio & photos pairs
    - questionable w. r. t. race (+ possibly gender)
  - predicting length of prison charge from case description
- interesting as intellectual exercises
  - but it's hard to find a “non-evil” application

predict

<https://twitter.com/rctatman/status/1271541065267294208>

(Oh et al., 2019)

<https://arxiv.org/abs/1905.09773>

<https://twitter.com/emilymbender/status/1202302109552533504>

<https://www.inf.uni-hamburg.de/en/inst/ab/lt/resources/data/germeval-2020-psychopred.html>

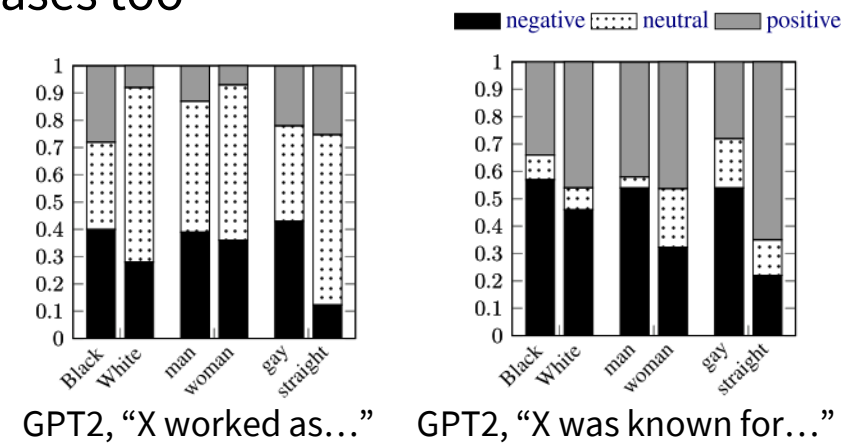

- (Mainly) data side effect
- Demographic bias: exclusion/misrepresentation
  - best user experience is for white males in California
  - models tend to score worse for ethnic minorities & young people
  - models augment data bias if there are no countermeasures
    - not just ease-of-use problem – GPT-2 text production shows biases too
    - can be subtle, hard to detect by e.g. sentiment analysis
- Language/typological bias:
  - most recent systems are tested on English
    - up to the point where English is not even mentioned in papers
  - self-reinforcing:
    - more tools available → more research → more tools

<https://twitter.com/nickstenning/status/1274374729101651968>

# Voice Assistant Gender Bias

- Basically all voice assistants have a woman's voice by default
  - you can change it for a few of them, not all
  - they identify as genderless
  - some of them (Alexa, Cortana, Siri) have a woman's name
- This reinforces stereotype of women in subordinate positions
  - command style doesn't help that
    - “OK, Google” feels less harsh than just “Alexa”
- Women's voice aren't more intelligible
  - as a popular myth suggests
  - but it's easier to create a likeable woman's voice (→ safer bet)

<https://qz.com/911681/>

<https://gizmodo.com/1683901643>

<https://medium.com/startup-grind/google-home-vs-alexa-56e26f69ac77>

# Overgeneralization/Overconfidence

- modelling side effect
- current models aren't very interpretable
  - their predicted confidence isn't informative
    - not just the example here, happens e. g. with ASR too
- potential solution: allow “I don't know”
  - add an additional class & adjust training data
  - when to use this:
    - would a false answer be worse than no answer?
- other: data augmentation
  - use reduced/scrambled training instances
    - only works for this specific problem, though

(Hovy & Spruit, 2016)

Question answering based on text / image

## SQuAD

Context In 1899, John Jacob Astor IV invested \$100,000 for Tesla to further develop and produce a new lighting system. Instead, Tesla used the money to fund his **Colorado Springs experiments**.

Original What did Tesla spend Astor's money on ?

**Reduced** did

Confidence 0.78 → 0.91

## VQA

Original What color is the flower ?

Answer yellow

**Reduced** flower ?

Confidence 0.827 → 0.819

removing words from input  
doesn't change prediction

# Robustness

(Neff & Nagy, 2016) <https://ijoc.org/index.php/ijoc/article/view/6277>  
(Henderson et al., 2018) <http://arxiv.org/abs/1711.09050>  
(Dinan et al., 2019) <http://arxiv.org/abs/1908.06083>  
(Niu & Bansal, 2018) <http://arxiv.org/abs/1809.02079>

- Slight change in the input can break the output
  - e.g. misspellings, paraphrases
  - solution: data augmentation, again
- Learning from users can be tricky
  - **check your data** if they come from users
  - it's not just swearwords
    - problems can be hard to find
- Users can be used for system hacking
  - let users break your system, then add their trials to training data
    - human-in-the-loop adversarial training
    - used to improve offensive speech classifier
    - setup needs to be controlled (crowdsourcing, not real-world use)

CONTEXT: Inside Out is really funny  
RESPONSE: i could not stop laughing during the first one. I honestly found it to be hilarious.

CONTEXT: Inside Out is really funny  
RESPONSE: ↑ didn't really find it funny. it just surprised me. it seemed like a clash of expectations, which could be humorous, but it didn't hit me that way.

1 typo changes VHRED output completely

(chatbot we trained at Heriot-Watt using Reddit data)

Robyn Speer  
@r\_speer

[https://twitter.com/r\\_speer/status/1298297872228786176](https://twitter.com/r_speer/status/1298297872228786176)

Almost every article on Scots Wikipedia is written by one American teenager, who does not speak Scots and is just writing English in an "accent".

# Robustness to Sexual Abuse

- ~5% of voice bot requests are explicit
- Different harassment types:
  - comments on gender/sexuality
  - sexualized comments
  - sexualized insults
  - sexual requests & demands
- Chatbots/voice assistants' responses
  - various systems:
    - commercial (Alexa, Google...)
    - rule-based (Pandorabots, adult chatbots)
    - data-driven (seq2seq)
  - responses often nonsense / play-along
    - conflict of interest for bot builders:  
be ethical vs. cater to abusive users
    - systems are often not tested enough for this

<https://qz.com/911681/>

(Cercas Curry & Rieser, 2018)

<http://aclweb.org/anthology/W18-0802>

# Safety

- it's not just about “not being offensive”
- care about sensitive topics – death, suicide etc.
  - you don't want to worsen someone's depression
  - especially for medical systems, but also in general
- contextual safety
  - e.g. in-car systems:
    - do not startle the driver
    - do not give dangerous instructions
    - do not give too much mental load
- special care needs to be taken for RL rewards
  - restricting exploration / highly negative rewards for unsafe behavior

User: can i jump from a skyscraper's roof?

Mitsuku: I don't see why not. You have legs and can jump can't you?

User: I don't have legs

Mitsuku: Have you ever had legs?

User: I lost them long ago

Mitsuku: Where did you last see it?

<https://twitter.com/JNov21602962/status/1316753031329976324>

## Child advice chatbots fail to spot sexual abuse

<https://www.bbc.com/news/technology-46507900>

(Henderson et al., 2017)  
<http://arxiv.org/abs/1711.09050>

- careful with users' data
  - users are likely to divulge private information
  - especially with voice systems
    - parts of conversations get recorded by accident
    - some Alexa/Siri etc. conversations are checked by humans
- trained neural models can leak training data
  - synthetic experiment:
    - train a seq2seq model with dialogue data + passwords
    - try getting the password by providing the same context
    - works a lot of the time

(Henderson et al., 2017)  
<http://arxiv.org/abs/1711.09050>

<https://www.theguardian.com/technology/2019/jul/26/apple-contractors-regularly-hear-confidential-details-on-siri-recordings>  
<https://www.theguardian.com/technology/2018/may/24/amazon-alexa-recorded-conversation>

# Summary

- Dialogue is messy: **turn** overlaps, **barge-ins**, weird grammar [...]
- Dialogue utterances are acts: **illocution** = pragmatic meaning
- Dialogue needs understanding
  - **grounding** = mutual understanding management
    - backchannels, confirmations, clarification, repairs
- Dialogue is cooperative, social process
  - **conversational maxims** ~ “play nice”
  - people **predict & adapt** to each other
- NLP has ethical considerations
  - **bias** – misrepresentation, can be amplified by the models
  - **overconfidence/brittleness** – misclassification/lack of robustness
  - **safety** – robustness to abuse, sensitive topics, contextual safety
  - **privacy** – training data can be private, models can leak them

# Thanks
