NPFL099 Statistical Dialogue Systems
12. Multimodal Systems
(+some notes on domain adaptation)

http://ufal.cz/npfl099
Ondřej Dušek & Vojtěch Hudeček
5. 1. 2021
Multimodal Dialogue Systems

• adding more modalities to voice/text
  • input:
    • touch
    • drawing
    • gaze, gestures, facial expressions
    • voice pitch/tone
    • image
  • output:
    • graphics
    • gaze, gestures, facial expressions, body movement

• either traditional/modular and mostly rule-based systems, or very experimental (not much use in practice)
Standard Multimodal DS Schema

- basically the same as voice/text DSs
- adding multiple input modules
  - for multiple modalities
  - each with its own NLU-like interpretation
  - interpretations are merged
- multiple output modules
  - each with its own generation
  - dialogue manager output is split
- typically ready-made off-the-shelf modules
  - it’s too complex/costly to build these custom

https://www.lsv.uni-saarland.de/multimodal-dialogue-systems-summer-2019/
Smart Devices

• Phones, wearables, smart speakers with a display
  • incl. Google Assistant, Alexa & Siri
  • admittedly not so much dialogue, more of commands
  • cloud-based operation for most

• Input
  • touch: active & passive gestures (touch/accelerometer)
    • “raise to speak”
    • rarely visually sensing gestures
    • doesn’t support gaze

• Output
  • graphics: card interface
  • generation functions rule-based/low-level

https://www.wearable.com/android-wear/how-to-use-voice-commands-on-android-wear
https://www.cnet.com/reviews/amazon-echo-spot-review/
“Classical” Multimodal Systems

- closed-domain task-oriented dialogue systems
- map-based: town information with map input & output
  - touch / pen – drawing, map display
  - reacting to zooming, area selection
  - handwriting recognition (as alternative input)
- similar to Google Assistant, but more interactive
- in-car: voice & button control
- custom architectures
  - off-the-shelf modules
  - rule-based touch input processing

(Johnston et al., 2002) https://www.aclweb.org/anthology/P02-1048/
(Johnston et al., 2014) https://www.aclweb.org/anthology/W14-4335
(Becker et al., 2006) https://www.aclweb.org/anthology/P06-4015

S: I found 3 albums by The Beatles in your collection
<shows listing on screen>
U: Play the third one.
U: Which songs are on this one?
<selects an album from listing on screen>
Virtual Agents

- character face/full body
  - on screen or 3D projected (FurHat)

- a lot more outputs
  - full motion video – facial expressions, gaze, gestures, body movement
    - a lot of it “automatic”, designed to look natural/match what’s said

- additional inputs – gaze & facial expression
  - checking user engagement/sentiment

- dialogue management mostly rule-based
  - retrieval with non-linguistic inputs (Virtual Humans/SimSensei)
  - limited-domain custom rules (FurHat)

- tutoring/training, healthcare

https://vhtoolkit.ict.usc.edu/
https://youtu.be/ejczMs6b1Q4

Al Moubayed et al., 2012
https://doi.org/10.1007/978-3-642-34584-5_9
(Rushforth et al., 2009)
https://doi.org/10.1007/978-3-642-04380-2_82
(DeVault et al., 2014)
https://dl.acm.org/doi/10.5555/2615731.2617415
Robots

• similar to virtual agents, but with actual hardware
  • different user’s perception
    • body gestures more prominent
    • touching the robot is possible
  • situated deployment – need to track user engagement
    • is the user still talking to the robot?
  • hardware limitations
    • mostly no facial expr./gaze output, some sensors missing etc.
• off-the-shelf robots (Nao, Pepper)
  • built-in & additional sensors (e.g. Kinect)
  • custom rule-based gesture generation
  • controlled via a computer (not autonomous)
• “receptionist” – directions, information

(Bohus et al., 2014)  https://dl.acm.org/doi/10.5555/2615731.2615835
Multi-party Dialogue

• Relevant for both virtual agents & robots
  • supported by most previously mentioned projects
• How to handle multiple counterparts?
  • users or other robots/virtual agents
• gaze/engagement/speech detection
  • who’s speaking/looking etc.
• rules for multiple counterparts
  • switching gaze to address them
    • here, 3D is better than 2D (otherwise gaze ambiguous)
  • telling one to wait for another
• customer service, information

https://youtu.be/oOp4XP_ziMw
http://www.danbohus.com/
(Foster et al., 2012)
(Bohus et al., 2014)
(Skantze & Al Moubayed, 2012)

Interaction 1
(Socially inappropriate)
One person, A, approaches the bar and turns towards the bartender
Robot (to A): How can I help you?
A: A pint of cider, please.
A second person, B, approaches the bar and turns towards the bartender
Robot (to B): How can I help you?
B: I'd like a pint of beer.
Robot: (Serves B)
Robot: (Serves A)

Interaction 2
(Socially appropriate)
Robot (to A): How can I help you?
A: A pint of cider, please.
Robot: (Serves A)
Robot (to B): Thanks for waiting.
B: I'd like a pint of beer.
Robot: (Serves B)
Specific uses

- Air traffic controller training – radar as a modality
  - multiple agents/systems representing pilots
  - radar charting each agent’s behavior
  - single ASR, many TTSs
    - varied accents
  - all rule-based
    - very limited domain
    - bearings, flight levels

End-to-end Multimodal

• recent, experimental
• enhancing end-to-end DS architectures with image input
  • no video input
  • no avatars, facial expressions, gestures etc.
  • not much graphics output either
• also using off-the-shelf components
  • especially for image recognition – ready-made convolutional architectures
  • textual parts based on known architectures (HRED, MemNN etc.)
• mostly just end-to-end prediction
  • pretrained image recognition parts are kept fixed, no end-to-end training
Pretrained convolutional nets

- **Data**: ImageNet Challenge
  - >1M images, 1000 classes
  - just classify the object in the image
  - CNNs are way better than anything that came before them

- **AlexNet** – 1st deep CNN
  - 5 conv layers, ReLU activations, max pooling & 3 dense layers

- **VGGNet** – improvement
  - more layers, smaller CNN kernels (3x3, 2x2 pooling with stride 2)
    - reduces # of parameters, same function

https://towardsdatascience.com/the-w3h-of-alexnet-vggnet-resnet-and-inception-7baaeccccc96

Pretrained CNNs

- **ResNet** – residual networks
  - trying to simplify the mappings found by CNNs
    - with regular CNNs, deeper might not be better (vanishing gradient problem)
  - “shortcuts”: adding identity / linear projection to convolutions
    - learning a residual CNN mapping (“what projection can’t handle”)
  - allows much deeper networks – alleviates vanishing gradients

- **Inception** – more CNN kernels in parallel
  - for detecting different-sized object features
  - 1x1 depth reductions, depth-wise concatenations
  - better results with shallower networks

https://towardsdatascience.com/the-w3h-of-alexnet-vggnet-resnet-and-inception-7baaaecccc96
(He et al., 2016) https://arxiv.org/abs/1512.03385
(Szegedy et al., 2015) http://arxiv.org/abs/1409.4842
Pretrained CNNs

- **Faster R-CNN**
  - object detection – harder task
  - detecting boxes (regions) for multiple objects in image

- **Pipeline:**
  - Region prediction network (detect salient boxes)
  - Region-of-interest pooling (consolidate features)
  - Region-based CNN (classify)

Region prediction

• pretrained VGG as feature extraction
  • features for each of the anchor points (regularly spaced in the image)

• for each anchor point, predict:
  • anchor base size & h/w ratio (e.g. 64-128-256px, 0.5/1/1.5)
  • $p$(this is object) & $p$(this is background)
  • anchor $\Delta x$, $\Delta y$, $\Delta h$, $\Delta w$
  • all of this via convolutions 😊

• trained using object/non-object anchors
• overlapping predictions unified

R-CNN classification

- basically the same as image classification (given region)
  - with one more box coordinates fix
- sharing VGG features from RPN
  - this makes it much faster (only the pooling & prediction layers are new)

Using Transformers

(Carion et al., 2020)

- **Object detection: CNN + Transformer**
  - trained end-to-end
  - predicts all objects at once
    - max. $k$ objects: class + box (or “null”)
  - set-based loss (any order allowed)

- **Classification: Transformer-only**
  - split image into 16x16 patches
    - flatten (256xRGB=768-dim)
    - pass through a single “embedding” matrix
    - feed into standard transformer
  - adding positional embeddings
  - special “start” token
    - attention here used in a feed-forward classifier

(Dosovitskiy et al., 2020)
**Task**: have a meaningful dialogue about an image

- close to visual QA: **human asks, system responds**
- but VD is multi-turn & human doesn’t see the image (just a caption)
  - follow-up questions possible – coreference
  - people are not primed by the image when asking questions

- not much realistic purpose other than to test the models
- dataset of 10-turn dialogues on 120k images
  - collected via crowdsourcing
  - connecting 2 people live to talk about an image
  - not very deep dialogue: history only needed in ~11% cases

(慈等, 2017)
Base Visual Dialogue Models

(Das et al., 2017) http://arxiv.org/abs/1611.08669

Hierarchical Recurrent Encoder

Late fusion

simple projection to initialize decoder

LSTM decoder (same for all)

basic encoders for everything

VGG (same for all)

Memory Network

memory (1 hop only)
Visual Dialogue Evaluation

- BLEU etc. possible but not used here
- IR setup used instead
  - system given ground-truth dialogue history + user input & 100 candidate answers to score/rank
- IR metrics:
  - **ground-truth response rank** (average)
  - **recall@k** (% cases where ground-truth is included in top k)
  - **mean reciprocal rank**: $\frac{1}{\text{ground truth rank}}$ (1 if ground truth is first, 0.5 if second etc.)
  - **normalized discounted cumulative gain**
    - for multiple acceptable answers out of the 100 candidates
    - DCG: $\sum_{i=1}^{100} \frac{c_i \text{ relevant?}}{\log_2(i+1)}$, normalize by highest possible DCG (all good answers on top)
- problem: images only give modest gain over text-only models

https://visualdialog.org/challenge/2019#evaluation  
https://en.wikipedia.org/wiki/Discounted_cumulative_gain  
• human questioner replaced by “Q-bot”
  • Q-bot needs to guess an image
• using HRE architecture for both
  • Q-bot produces a VGG-like image representation
  • both trained via REINFORCE
• same reward for both: lowered difference of Q-bot’s predicted representation to the ground-truth image
  • per turn
• curriculum learning
  • start with fully supervised
  • use RL only for last \( k \) turns
  • increase \( k \)
• combination with supervised works best
Guess What

- guessing one of the objects in an image
  - GuessWhat data (150k guessing dialogues)
- 3 models:
  - question generation – LSTM
    - running through all previous questions
    - conditioned on VGG image features & previous replies
  - “oracle” – reply generation (Y/N/NA)
    - feed-forward from LSTM question encoding
      + object category + object size & position in image
  - guesser – select object from list of candidates
    - dot product & softmax over last LSTM generator state
      + candidate objects categories & sizes/positions
    - triggered at the end of the dialogue
- trained jointly with RL

(Sstrub et al., 2017)
https://www.ijcai.org/proceedings/2017/385

better model: (Suglia et al., 2020) https://www.aclweb.org/anthology/2020.coling-main.95
• Open chat about an image
  • no particular task
  • specific personality traits of both participants
• Crowdsourced data
  • ~200k dialogues, 3 turns per dialogue (A-B-A)
  • A & B have predefined personalities
• Evaluation: recall@1 (out of 100 candidates)
• Model – pretrained CNNs & transformers
  • ResNet & Faster R-CNN
  • Transformer encoders for context & response candidate
    • ranking only
  • self-attention-based “combiner” on top

(Ju et al., 2019)
http://arxiv.org/abs/1912.12394

(Shuster et al, 2018)
http://arxiv.org/abs/1811.00945

A: Fearful   B: Miserable
A: I just heard something out there and I have no idea what it was.
B: It was probably a Wolf coming to eat us because you talk too much.

A: Stylish   B: Fatalistic
A: Riding a mechanical bull in a skirt is just my style.
B: You’d probably fall off and get hurt.

A: Money-Minded   B: Glamorous
A: You know money doesn’t grow on trees.
B: I could see some high society ladies having their brunch over looking this canal.
A: I could see them spending way too much on avocado toast here.
Shopping Dialogues

(Saha et al., 2018)  
http://arxiv.org/abs/1704.00200

- a more practical task: fashion e-shop
  - both user & system can show images
  - user can reference/talk about images
- semi-automatic data (150k dialogues)
  - 84 predefined intents
  - generated dialogue flows
    - based on predefined state automata over intents
  - utterances for each intent written by annotators
  - backed by a large manually curated DB
  - of fashion items with images (1M items)
    - taxonomy (man > apparel > lower body > trousers)
    - (generated) celebrity profiles/endorsements

SHOPER: Hello
AGENT: Hello, is there anything I can help you with today?
SHOPER: show me some espadrilles in beige/blue within $200.
AGENT: Sure. Let me just quickly browse through my catalogue.

AGENT: What you can see in the fifth item, Michael Michael Kors brings you an effortless weekend look with the wrapped espadrille heel and crisscross styling of these dana flats. And what you see in the 3rd item, Steve Madden, the company, was founded by Steve Madden, the man, in 1990 in Brooklyn, where he started out making trend-advancing shoes one pair at a time.

SHOPER: List more in the upper material as in the 5th image and style as the 3rd and the 5th.

AGENT: Image from the front, right and back orientations respectively

SHOPER: And the 3rd one?

AGENT: Image from the front, right, back and left orientations respectively

Shopping Dialogues

- Models similar to visual dialogue
  - variants of multimodal HRED
  - VGG image input
- image input
  - turn-level
  - concatenated with utterance
    - seems to work better (fewer turns)
- text/image responses
  - shared encoder
  - text generation (word-by-word)
  - image ranking (needs rough retrieval)
    - so far just “select 1 out of 5”

(Saha et al., 2018) [http://arxiv.org/abs/1704.00200](http://arxiv.org/abs/1704.00200)
(Agarwal et al., 2018) [http://aclweb.org/anthology/W18-6514](http://aclweb.org/anthology/W18-6514)
Using Images to boost NLU

• Grounding all words to images – “vokenization”
  • images + captions, nearest neighbor search → assigning an image to each word – **voken**
  • train a **vokenizer** (LM assigning images to tokens) on this
  • apply it to **vokenize** large training data for BERT

• Finetuning BERT with:
  • masked language modelling (as usual)
  • predicting a voken for all words (masked or not)
    • classification – mimicking the vokenizer

• Further finetuning for a NLU task
  • better performance when vokens were used

(Tan and Bansal, 2020)
Domain Adaptation

• pretraining
  • BERT, but also any other model
  • weight sharing: copy weights for similar slots in target domain

• delexicalization
  • assuming your domains are similar (e.g. TVs → PCs)

• pseudo in-domain data selection
  • find data similar to your domain in the source domain

• forcing shared latent space (see few-shot end-to-end models)

• multi-task training
  • your task in source domain & different task in target domain

• partial handcrafting (see Hybrid Code Networks)
Summary

• “traditional” multimodal systems, with components
  • combination of off-the-shelf components
    • parallels for ASR/NLU & NLG/TTS in I/O modalities
  • dialogue typically quite simple
  • modalities: static graphics / touch / gaze / facial expr. / avatars / robots
  • often support multi-party dialogue

• end-to-end multimodal systems
  • mostly experimental, based on HRED with pretrained CNNs
    • VGG, ResNet, Inception (just image classification), Faster R-CNN (+object detection)
  • visual dialogue: questions & answers about an image
  • guessing: finding an object in image
  • image chat: open-domain, based on image
  • task-oriented: shopping dialogue with product images
Thanks

References/Inspiration/Further:
• Volha Pethukova’s course (Uni Saarland):
  https://www.lsv.uni-saarland.de/multimodal-dialogue-systems-summer-2019/
• McTear et al. (2016): The Conversational Interface – Talking to Smart Devices
• papers referenced on slides

Labs in 10 mins
Exam info follows
Default Exam

• In-person written test, ~10 questions
  • 60% = pass (C), 73%+ = B, 88%+ = A
  • points might be adapted based on your overall performance
  • expected 1 hr, but you’ll be given at least 2hrs (no pressure on time)

• Covering all lectures

• Question format:
  • you’ll need to write stuff on your own (not a-b-c-d)
  • explanation of terms/concepts
    • no exact formulas needed (if needed, they might be provided)
    • but you should know the principles of how stuff works
  • relationships between concepts (“what’s the difference between X & Y”) 
  • “how would you build X”
  • focused on “important” stuff – see summaries at the end of each lecture
• essay on a dialogue systems topic (choose 1 out of 3 topics given)
  • 3 pages/1500 words (excluding references)
  • explain problem
  • introduce different approaches (include non-neural if applicable)
  • compare pros and cons of individual approaches
    • not just “this has better BLEU” – show different aspects
  • cite relevant sources (10+)
    • some mentioned in passing, some described in detail
    • feel free to use materials referenced on slides
  • write in language of your choice (as long as I understand it 😊)

• 1 week deadline (hard!) to finish after you’re given topics
  • after deadline: scheduled video call with discussion

• grading: completeness, coherence/readability, factual correctness
