Projection of Trees across Parallel Texts

- Rebecca Hwa, Philip Resnik, Amy Weinberg, Clara Cabezas, Okan Kolak (2004). Bootstrapping Parsers via Syntactic Projection across Parallel Texts

- Source: English
- Target: Spanish, Chinese
- Dependency trees (not phrase structure)
Given sentence pair \((E, F)\) and a set of syntactic relations for \(E\), where \(E = e_1, ..., e_n\) is an English sentence and \(F = f_1, ..., f_m\) is its non-English parallel, syntactic relations \(R(x, y)\) are projected from English as follows:

- **one-to-one** – \(e_i\) aligned with a unique \(f_x\) and \(e_j\) aligned with a unique \(f_y\) – then
  \[ R(e_i, e_j) \Rightarrow R(f_x, f_y) \]

- **unaligned English** – \(e_j\) not aligned with any word in \(F\) – create new empty word \(f_y\) so that for any \(e_i\) aligned with a unique \(f_x\),
  \[ R(e_i, e_j) \Rightarrow R(f_x, f_y) \]  and   \[ R(e_j, e_i) \Rightarrow R(f_y, f_x) \]

- **one-to-many** – \(e_i\) aligned with \(f_x, ..., f_y\) – then create new empty \(f_z\), parent of \(f_x, ..., f_y\), and set \(e_i\) to align to \(f_z\) instead

- **many-to-one** – \(e_i, ..., e_j\) uniquely aligned to \(f_x\) – then keep the head of \(e_i, ..., e_j\) aligned to \(f_x\), and delete other alignments

- **many-to-many** – decompose: first one-to-many, then many-to-one

- **unaligned foreign** – leave them out of the projected tree
Direct Projection

Given sentence pair \((E, F)\) and a set of syntactic relations for \(E\), where \(E = e_1, ..., e_n\) is an English sentence and \(F = f_1, ..., f_m\) is its non-English parallel, syntactic relations \(R(x, y)\) are projected from English as follows:

- **one-to-one** – \(e_i\) aligned with a unique \(f_x\) and \(e_j\) aligned with a unique \(f_y\) – then
  \[ R(e_i, e_j) \Rightarrow R(f_x, f_y) \]

- **unaligned English** – \(e_j\) not aligned with any word in \(F\) – create new empty word \(f_y\) so that for any \(e_i\) aligned with a unique \(f_x\), \(R(e_i, e_j) \Rightarrow R(f_x, f_y)\) and
  \[ R(e_j, e_i) \Rightarrow R(f_y, f_x) \]

- **many-to-one** – \(e_i, ..., e_j\) uniquely aligned to \(f_x\) – then keep the head of \(e_i, ..., e_j\) aligned to \(f_x\), and delete other alignments

- **many-to-many** – decompose: first one-to-many, then many-to-one

- **unaligned foreign** – leave them out of the projected tree
Direct Projection

Given sentence pair \((E, F)\) and a set of syntactic relations for \(E\), where \(E = e_1, ..., e_n\) is an English sentence and \(F = f_1, ..., f_m\) is its non-English parallel, syntactic relations \(R(x, y)\) are projected from English as follows:

Direct Projection

Given sentence pair \((E, F)\) and a set of syntactic relations for \(E\), where \(E = e_1, ..., e_n\) is an English sentence and \(F = f_1, ..., f_m\) is its non-English parallel, syntactic relations \(R(x, y)\) are projected from English as follows:

- **one-to-one** – \(e_i\) aligned with a unique \(f_x\) and \(e_j\) aligned with a unique \(f_y\) – then
  \[
  R(e_i, e_j) \Rightarrow R(f_x, f_y)
  \]

- **unaligned English** – \(e_j\) not aligned with any word in \(F\) – create new empty word \(f_y\) so that for any \(e_i\) aligned with a unique \(f_x\), \(R(e_i, e_j) \Rightarrow R(f_x, f_y)\) and \(R(e_j, e_i) \Rightarrow R(f_y, f_x)\)

- **one-to-many** – \(e_i\) aligned with \(f_x, ..., f_y\) – then create new empty \(f_z\), parent of \(f_x, ..., f_y\), and set \(e_i\) to align to \(f_z\) instead

- **many-to-one** – \(e_i, ..., e_j\) uniquely aligned to \(f_x\) – then keep the head of \(e_i, ..., e_j\) aligned to \(f_x\), and delete other alignments

- **many-to-many** – decompose: first one-to-many, then many-to-one

- **unaligned foreign** – leave them out of the projected tree
Direct Projection Example

He took a picture of my daughter.

Vyforti si moj dceru
He took a picture of my daughter.

Vyfotil si moji dceru
He took a picture of my daughter.

```
f1  f2  f3  Vytotil  si  f6  moji  dceru
  nsubj  det  obj
  nmod
```

Direct Projection Example
He took a picture of my daughter.
He took a picture of my daughter.
He took a picture of my daughter.
He took a picture of my daughter.

Directed Projection Example 2
He took a picture of my daughter.

Vyfotil si moji dceru
He took a picture of my daughter Vyfotil si moji dceru.
He took a picture of my daughter.
He took a picture of my daughter.
Many-to-One Assumption:
$e_i, ..., e_j$ Is a Phrase with One Head

He took a picture of my daughter

Vyfotil si moji dceru
Many-to-One Assumption: \( e_i, \ldots, e_j \) is a phrase with one head. What if not?
Experiments with Direct Projection

• 100 gold trees projected from English to Spanish
• 88 gold trees projected from English to Chinese

• Word alignments are gold-standard too!
  • The goal is just to check the direct correspondence assumption.
Experiments with Direct Projection

• 100 gold trees projected from English to Spanish
• 88 gold trees projected from English to Chinese

• Word alignments are gold-standard too!
  • The goal is just to check the direct correspondence assumption.

• Compared with target gold-standard trees
  • Spanish unlabeled F-score = 37%
  • Chinese unlabeled F-score = 38%
Problems

- Many-to-one deletes alignments $\Rightarrow$ tree is not connected
  - Possible solution: transitive closure?

He took a picture of my daughter

\[ f_1 \quad \text{Vyfotil} \quad \text{si} \quad f_6 \quad \text{moji} \quad \text{dceru} \]
Problems

• Many-to-one deletes alignments ⇒ tree is not connected
  • Possible solution: transitive closure?

He took a picture of my daughter

Projection of Trees across Parallel Texts
Problems

• Many-to-one deletes alignments $\Rightarrow$ tree is not connected
  • Possible solution: transitive closure?

• Unaligned foreign words remain unattached
  • Possible solution: postprocessing with target language knowledge
Postprocessing Rules

- A few dozen rules, less than a month work

- Spanish example
  - A reflexive clitic should modify the verb to its left.

- Chinese example
  - An aspectual marker should modify the verb to its left.
Experiments with Postprocessing on Gold Data

- 100 gold trees projected from English to Spanish
- 88 gold trees projected from English to Chinese

- Word alignments are gold-standard too!

- Compared with target gold-standard trees
  - Spanish unlabeled F-score = 70%
  - Chinese unlabeled F-score = 67%
Real-World Setting

- Collins Model2 (1997) English parser trained on Penn Treebank / WSJ
- Converted to dependencies (Magerman 1994, Xia and Palmer 2001)

- Word alignments computed with GIZA++ (Och and Ney 2003)
  - 100K en-es sentence pairs (Bible, Federal Broadcasting Information Service, United Nations Parallel Corpus)
  - 240K en-zh sentence pairs (Federal Broadcasting Information Service)

- Project trees using direct correspondence + postprocessing
Real-World Setting

- Collins Model2 (1997) English parser trained on Penn Treebank / WSJ
- Converted to dependencies (Magerman 1994, Xia and Palmer 2001)

- Word alignments computed with GIZA++ (Och and Ney 2003)
  - 100K en-es sentence pairs (Bible, Federal Broadcasting Information Service, United Nations Parallel Corpus)
  - 240K en-zh sentence pairs (Federal Broadcasting Information Service)

- Project trees using direct correspondence + postprocessing
- Aggressive filtering: discard projected trees of poor quality
Real-World Setting

- Collins Model2 (1997) English parser trained on Penn Treebank / WSJ
- Converted to dependencies (Magerman 1994, Xia and Palmer 2001)

- Word alignments computed with GIZA++ (Och and Ney 2003)
  - 100K en-es sentence pairs (Bible, Federal Broadcasting Information Service, United Nations Parallel Corpus)
  - 240K en-zh sentence pairs (Federal Broadcasting Information Service)

- Project trees using direct correspondence + postprocessing
- Aggressive filtering: discard projected trees of poor quality
- Train Collins dependency parser (1999) on remaining trees
- Apply the parser to unseen target-language sentences
Pruning Criteria

• Based on tuning on development set, discard if...
  • > 20% of the English words have no Spanish counterpart
Pruning Criteria

- Based on tuning on development set, discard if...
  - > 20% of the English words have no Spanish counterpart
  - > 30% of the Spanish words have no English counterpart

Additional criteria for English-Chinese:
- Crossing dependencies
- Number of unattached nodes after postprocessing
- Number of words with unknown POS category

20K projected Spanish trees after filtering
50K projected Chinese trees after filtering
Pruning Criteria

• Based on tuning on development set, discard if...

  • > 20% of the English words have no Spanish counterpart
  • > 30% of the Spanish words have no English counterpart
  • > 4 Spanish words were aligned to the same English word
Pruning Criteria

Based on tuning on development set, discard if...

- > 20% of the English words have no Spanish counterpart
- > 30% of the Spanish words have no English counterpart
- > 4 Spanish words were aligned to the same English word
- Additional criteria for English-Chinese:
  - Crossing dependencies
  - Number of unattached nodes after postprocessing
  - Number of words with unknown POS category
Pruning Criteria

• Based on tuning on development set, discard if…
  • > 20% of the English words have no Spanish counterpart
